Offline IS Word form

The purpose of this form is to help in collecting data on a Ramsar Site for the completion of an online Ramsar Information Sheet (RIS) at <https://rsis.ramsar.org>. It can be circulated between the National Focal Point, RIS compilers and other national data collectors. However, it is not accepted by the Ramsar Secretariat for submission of a Site update or new Site designation. The data collected through this form must be transferred to the online form by the National Focal Point or an authorized online RIS compiler.

All fields marked with an asterisk (*) are required.

For more information on how to use this form, please refer to the document

[How to use the offline RIS Word form.](#)

Summary

1.1 Summary description

Please provide a short descriptive text summarising the key characteristics and internationally important aspects of the site. You may prefer to complete the four following sections before returning to draft this summary.

Summary (This field is limited to 2500 characters)

Lake Ohrid is an ancient oligotrophic inland freshwater with between 1.3 and 1.9 million years of continuous existence. It is the oldest and deepest lake by average depth in Europe and a World Heritage Site since 1979. Hosting 1,200 species, over 200 of them endemic, it displays one of the highest rates of biodiversity of any inland water on Earth when measured by surface area. While some of its world-unique species are relicts whose relatives exist only as fossils in other locations, many have evolved in-lake over its long, isolated natural history

Part of the reason for Lake Ohrid's exceptional flora and fauna is that underground karst channels supply over 50% of its water via subaquatic and terrestrial springs. These springs are chemically individual, creating specific micro-habitats that contain globally singular species within tight natural boundaries. Beyond the springs, oxygen-rich conditions and a wide photic zone furnish vertical habitats to depths of 150m too, supporting endemic taxa throughout the food web from phytoplankton to predatory fish.

Banked east and west by the Galichica and Jablanica/Mokra Mountains, Lake Ohrid moderates climate, allowing refugium habitats in the local region, which enjoys elevated floral diversity matched by variety in many species categories. With a single outflow, the River Black Drim ultimately flowing to the Adriatic Sea, Lake Ohrid is also a major component of the species-rich Drim Basin

Studenchishte Marsh, a remnant of previously extensive shoreline wetlands, furthers Lake Ohrid's biological diversity, containing wet meadows, alkaline marshes and fens; the largest lowland peat histosol range in Macedonia; and relict plant associations with nationally protected fauna within. It supports water clarity and quality of the wider lake area through nutrient-filtering, thereby contributing to the maintenance of Ohrid's once-in-a-world ecosystems

Both Lake Ohrid and Studenchishte provide important paleoenvironmental archives within peat layers and sediment. The latter has already produced extensive sediment cores that, combined with the lake's peculiar flora and fauna, are providing insight into climate history and the relationship between biological and geological evolution.

People have settled Lake Ohrid for up to 8,000 years. The region therefore contains numerous archaeological sites, some underwater, and constitutes an important resource for understanding human and wetland coexistence over several millennia.

Lake Ohrid and Ohrid Region are included into several development and strategic documents adopted by Macedonian Government and Macedonian Parliament:

- Spatial Plan of Republic of Macedonia (2004-2020),
- Spatial Plan for Ohrid –Prespa Region (2005-2020),
- Sectoral Study of Natural Heritage for preparation Spatial Plan of RM (2004-2020),
- National Strategy for Biodiversity and Action Plan (2018-2023),
- National Strategy for Nature and Action Plan (2017-2027).

2.2.1 Defining the Site boundaries

The site boundaries must be clearly delineated on both: a) a GIS shapefile and b) a digital map/image:

*-> To define the site boundaries please complete field 2.2.1 a1), 2.2.1 a2) and 2.2.1 b) via the online form. -
UPLOAD via online form-*

Boundaries description (This field is limited to 2500 characters)

The boundary of Ramsar site - Ohrid Lake follows the shore line of lake, include area of Studenchishte Marsh, locality Sveti Naum and parts of wetlands near the Lake.

Ramsar Site - Ohrid lake is within both the UNESCO World Heritage Site designated as Natural and Cultural Heritage of the Ohrid Region and the UNESCO Transboundary Biosphere Reserve Ohrid-Prespa, and overlaps with parts of National Park Galichica, The biodiversity hot spots localities identified in the boundaries of UNESCO World Heritage Site designated as Natural and Cultural Heritage of the Ohrid Region is also include into to the boundaries of Ramsar site-Ohrid Lake.

The proposed Ramsar Site „Ohrid Lake” is protected at national level as Monument of nature (III category IUCN) and is also proposed as an Emerald Site (Bern convention). According law on Nature protection Ohrid lake should be re-proclaim.

Within the GEF / UNEP Project "Achieving Biodiversity Protection through the Creation and Effective Management of Protected Areas and Biodiversity Maintenance in Land Use Planning" (STAR 5) in coordination with the MoEPP in cooperation with UNEP and IUCN ENCARO and local experts, in 2020 started activities for preparation of Study for valorisation and Draft Management Plan for Monument of Nature Ohrid lake.

Also, Study for valorization of Studenchishko Marsh was developed. Pursuant to the Law on Nature Protection, based on the study, the Ministry of Environment in September 2020 initiated a procedure for declaring Studenchishko Marsh as a protected area in category IV - Nature Park.

Ohrid Lake is identified as future Natura 2000 site (SPA - Special Protected Area) according to Birds Directive 2009/147/EC and the site is adjacent to the Albanian IBA site "Lake Ohrid" (AL002, Heath & Evans 2000).

2.2.2 General location

a) In which large administrative region does the site lie?

Ohrid Municipality, Struga Municipality and Debarca Municipality

b) What is the nearest town or population centre?

1) Ohrid 2) Struga

2.2.3 For wetlands on national boundaries only

a) Does the wetland extend onto the territory of one or more other countries?

☒ Yes / ☐ No

b) Is the site adjacent to another designated Ramsar Site on the territory of another Contracting Party?

☐ Yes / ☒ No

c) Is the site part of a formal transboundary designation with another Contracting Party?

☐

☐ Yes / ☒ No

d) Transboundary Ramsar Site name:

N/A

2.2.4 Area of the Site

If you have not established an official area by other means, you can copy the area calculated from the GIS boundaries into the 'official area' box.

Official area, in hectares 25 205 (ha): *(The online RIS only accepts numeric values)*

Area, in hectares (ha) as calculated from GIS boundaries

2.2.5 Biogeography

Please provide the biogeographic region(s) encompassing the site and the biogeographic regionalization scheme applied:

Biogeographic regions

The site belongs to the alpine biogeographical region .

Regionalisation scheme(s) ¹	Biogeographic region
Freshwater	420: Southeast
Ecoregions of the World (FEOW)	Adriatic Drainages
European Union	Alpine
Biogeographical Regions	

[Other biogeographic regionalisation scheme](#) *(This field is limited to 2500 characters)*

¹ Marine Ecoregions of the World (MEOW) | Udvardy's Biogeographical Provinces | Bailey's Ecoregions | WWF Terrestrial Ecoregions | EU biogeographic regionalization | Freshwater Ecoregions of the World (FEOW) | Other scheme (provide name below)

Why is the Site important?

3.1 Ramsar Criteria and their justification

Tick the box against each criterion applied to the designation of the Ramsar Site. All criteria which apply should be ticked. Please explain why you selected a criterion by filling in the relevant fields on this page, on the three other pages of this section 'Criteria & justification' and on the 'Wetland types' page of the section 'What is the site like?'.

☒ **Criterion 1: Representative, rare or unique natural or near-natural wetland types**

To justify this Criterion, please select at least one wetland type as representative, rare or unique in the section 'What is the site like?' > Wetland types and provide further details in at least one of the three boxes below.

Hydrological services provided *(This field is limited to 3000 characters)*

Source of the River Black Drim, ancient, oligotrophic Lake Ohrid is a major component of the Drim Basin, supplying freshwater to hundreds of thousands of regional residents and visitors for recreational, agricultural and every-day purposes alike. By average depth, it is the deepest lake in Europe. It is also the oldest continuously existing inland water on the continent (Wagner et al, 2017).

Around 50% of Lake Ohrid's water enters via underground karst channels in the Mount Galichica massif from both sibling Lake Prespa and atmospheric precipitation that has been absorbed into the ground (Jordanoska, 2012). These channels filter and stabilize water conditions to produce varied micro-habitats at sublacustrine and surface feeder springs (Matzinger et al, 2006; Jordanoska et al, 2010; Matter et al 2010), supporting exceptionally clear, high-oxygen conditions in the lake proper, which has protected and evolved endemic species at every layer of the food chain (Albrecht & Wilke, 2008).

Studenchishte Marsh, a coastal wetland with alkaline marshes and fens, supplies water through groundwater discharge and regulates for the ecosystem services of the wider Lake Ohrid region by retaining nutrients, thereby buffering water clarity and quality against eutrophication pressures (Apostolova et al, 2016; Society of Wetland Scientists, 2018). This contributes to maintenance of both water for human needs and Lake Ohrid's world-unique freshwater ecosystems such as by helping to secure the deep photic zone required by native phytoplankton.

Other ecosystem services provided *(This field is limited to 3000 characters)*

With some of the oldest human settlements in Europe upon its shore, Lake Ohrid has furnished humanity with food, water and shelter during climate extremes for approximately 8,000 years. Even the characteristic local architecture has developed under the influence of the way light reflects from the water's surface (Jovanovic-Popovic et al, 2012), and archaeological sites indicate pre-Christian water-worship. It is therefore significant for the study of human interaction with wetlands over several millennia.

Derived from its unique ecosystem and sediment records stretching hundreds of thousands of years, Lake Ohrid is a key site for paleoenvironmental, paleoclimate and speciation research as well as the study of interplay between biological and geological evolution (Wagner, 2017). Its specific characteristics as a relatively small, accessible ancient lake with exceptional species richness make it almost uniquely suited to the function of a natural laboratory (Hauffe et al, 2011).

Beyond the capital Skopje, the Lake Ohrid region is the major attraction of the growing Macedonian tourism industry that contributes 6.6% to national GDP (World Travel and Tourism Council, 2018). The lake's exceptionally clear waters with Secchi depths of 7-15m in the pelagic zone (Wagner et al, 2017) support diverse recreation with significant combined contribution to the local economy including general beach activities, swimming, scuba-diving, sailing, fishing,

canoeing, paddleboarding and at least one professional sport event: the Ohrid Swimming Marathon, part of the FINA UltraMarathon Swim Series.

Fisheries, most notably for carp and Ohrid trout, continue to contribute both to residents' sustenance and the regional economy (GiZ, 20017).

Studenchishte Marsh, the final fully functioning remains of previously extensive coastal wetlands at Lake Ohrid, offers a paleoenvironmental archive of its own right through its stratified peat layers; constitutes a blueprint from which other regional wetlands can be rehabilitated; functions as a spawning ground for three commercially important fish taxa; and contributes to carbon capture via 300cm histosol peatlands, which are the largest remaining lowland peat histosols in the Republic of North Macedonia (Apostolova et al, 2016; Society of Wetland Scientists, 2018).

Other reasons *(This field is limited to 3000 characters)*

Lake Ohrid buffers temperature and dryness extremes in the wider region and interplays with the surrounding mountain relief to produce a microclimate that has served as a refugium for plants including the continual presence of trees across hundreds of thousands of years of glacial advances and contractions, a contributory reason for regional floral diversity of continental significance in the present day (Sadori et al, 2016). As the most long-lived lake in Europe, it provides this climate mitigation on timescales that cannot be approached by the vast majority of inland waters worldwide.

Lake Ohrid's moderating influence upon climate additionally enabled glacial remnant coastal wetlands to survive in the Ohrid region when warming temperatures and drying conditions in the post-glacial era caused Balkan valleys to desiccate and pushed such habitats northwards (Spirovska et al, 2012). With several similar wetland refugiums drained in the past century, Studenchishte Marsh on Lake Ohrid's north-east coast is therefore rare and representative in its own right, holding 50% of the marsh associations known for North Macedonia (Apostolova et al, 2016), including unusual floral combinations established during the glacial retreat (Spirovska et al,

2012). Indeed, Studenchishte now displays one of the few remaining examples of a lowland peatland in the Republic of North Macedonia (Spirovska et al, 2012).

[✓] Criterion 2: Rare species and threatened ecological communities

To justify this Criterion, please give details below on:

- relevant plant species in the section Criteria & justification> Plant species (3.2)

- relevant animal species in the section Criteria & justification> Animal species (3.3)

- relevant ecological communities in the section Criteria & justification> Ecological communities (3.4)

Optional text box to provide further information (This field is limited to 3000 characters)

Alongside numerous formally threatened species at regional, European and global levels, Lake Ohrid supports many endemics such as *Salmo letnica* that would likely trigger threatened status if sufficient IUCN-relevant data for population and trends were available. It additionally contains several taxa on the Republic of North Macedonia's List of Protected Wild Species and List of Strictly Protected Wild Species, which offer an indication of conservation interest in the absence of complete Red Lists for the country. In total, according to the IUCN Global Red List, Lake Ohrid harbors 26 species assessed as vulnerable; 17 as endangered; and 11 as critically endangered.

Important flora species of Lake Ohrid, at locality Kalishta are: *Nufar lutea*, *Nymphaea alba*, strictly protected species at national legislation.

The adjacency of Studenchishte Marsh's alkaline marshes and fens to an ancient lake with over a million years' continuous existence elevates its international significance and rareness as an ecotone, as does the presence of endemic diatoms and invertebrate taxa, relict plants, several species of waterbirds, and reptiles and amphibians that are protected/strictly protected on a national level. It is worth to mention the presence of the Blakan whip snake (*H.gemonensis*). This species distribution is restricted to Prespa region, Ohrid Lake region and River Drim valley. Therefore throughout the National Red List assessment it is recognized as endangered (EN).

Also very important locality for natural ecological character of Lake Ohrid is green belt of fragmites, at localite Podmolje, and fragments with *Alnus glutinosa* and *Tamarix* spp., near coastal (rivers and lake).

[✓] **Criterion 3 : Biological diversity**

To justify this Criterion, please give details in the box below. If you want to name any specific species, please give details on:

- relevant plant species in the section Criteria & justification> Plant species (3.2)

- relevant animal species in the section Criteria & justification> Animal species (3.3)

Justification (This field is limited to 3000 characters)

Lake Ohrid has been identified as one of two hotspots of aquatic biodiversity in Europe (Neubauer et al (2015). As the deepest (average) and oldest continuously existing European inland water, its comparatively stable conditions over hundreds of thousands of years have enabled both the preservation of relict species and the evolution of entirely new taxa, resulting in probably the highest ratio of endemism to surface area of any lake on Earth (Albrecht and Wilke, 2008), with at least 212 endemic species (182 animals) among 1,200 native taxa. These natives have adapted to Lake Ohrid's oligotrophic conditions, which are supported both by karst springs and the Studenchishte Marsh wetland (Apostolova et al, 2016).

Lake Ohrid is a major contributor to biodiversity in the Southeast Adriatic Drainages, one of the leading ecoregions globally for freshwater fish species density with >8 taxa for every 10⁴ km² (Hales, 2015). Predominantly balanced between cyprinid and salmonid fish, Lake Ohrid ichthyofauna is represented by 21 native species, 15 of which are characteristic for the Western Balkans, 13 for the Southeast Adriatic Drainages, and 8 endemic to Lake Ohrid.

To date, the adjusted rate of endemism for Lake Ohrid stands at 36% for all species and 34% for animals. Noteworthy are 72 gastropod species of which 78% cannot be found anywhere else on the planet. Other taxa demonstrate impressive endemism too: ciliophora (91% endemism among 34 native species overall), amphipoda (90% among 10), porifera (80% among 5), isopoda (75% among 4), triclada (79% among 29), ostracoda (63% among 52) and hirudinea (54% among 26) (Albrecht and Wilke, 2008). 88 species of birds related to the lake's ecosystem have been formally recorded, a number expected to rise with improved monitoring.

Recent studies of microflora have unveiled 789 diatom taxa for Lake Ohrid (Levkov and Williams, 2012), which will boost species totals even further. 117 are thought to be endemic and 15 relict. The lake is known as a hotspot of charophyte biodiversity (Albrecht & Wilke, 2008) with threatened species including *Chara ohridana* and *Chara kokeilli*, the former of which is known only for a small number of Balkan lakes.

The flora and fauna of Studenchishte Marsh is distinct from that of Lake Ohrid and therefore contributes substantially to the overall biodiversity of the site. Approximately 350 species are recorded for the marsh, 125 of which are rare and/or endemic (Spirovska et al, 2012). This is far from exhaustive as several important species groups (such as mammals) have not been thoroughly investigated but includes 79 bird species, 9 amphibian (Sterijovski & Arsovski 2019), 15 reptile (Sterijovski & Arsovski 2019), 15 fishes species, 46 beetle, 34 odonata and 9 Ohrid-endemic planarian taxa. From diatoms, 11 Ohrid-endemics from a total of 89 species have so far been identified (Spirovska et al, 2012). Throughout the National Red List Assessment of amphibians and reptiles, Studenchishte Marsh is on of the HOT-SPOTS of amphibian diversity (Sterijovski & Arsovski 2019). Moreover, although many Studenchishte species are more cosmopolitan than those in-lake, it yet contains plant associations such as *Caricetum elatae*, relicts of glacial wetlands that once abounded in Macedonia's former lacustrine valleys.

Related to the Lake Ohrid microclimate that preserves humidity and averts temperature extremes, the mountain massif on the lake's east coast, protected as National Park Galichica, further supports over 3,000 vascular plants and several endemic species. A complex fauna has developed within this rich plantlife, notably over 1,500 *Lepidoptera* taxa.

[✓] **Criterion 4 : Support during critical life cycle stage or in adverse conditions**

To justify this Criterion, please give details below on:

- relevant plant species in the section Criteria & justification> Plant species (3.2)

- relevant animal species in the section Criteria & justification> Animal species (3.3)

and explain the life cycle stage or nature of adverse conditions in the accompanying 'justification' box.

Optional text box to provide further information (This field is limited to 3000 characters)

For 212 in-lake endemic species, Lake Ohrid a priori supports during all critical life cycle stages and adverse conditions.

A large freshwater that never freezes, it additionally supports birds and other animals during harsh winters when other locations become unsuitable. On a more regular basis, avifauna from adjacent mountains moves to the shores of Lake Ohrid during the annual colder months (Vasic, 2010). In recent years, South East Europe's small, isolated population of *Mergus merganser* (goosander), which may indicate a Pleistocene refugium, has depended upon the lake increasingly for breeding and wintering (Catsadorakis, 2016). *Mergus merganser* (>1% of the population for the biogeographic region) additionally uses the site for moulting, as do *Podiceps cristatus*, *Microcarbo pygmaeus* and *Fulica atra*.

As an ancient lake with a constant presence over timescales measured in tens, hundreds and even thousands of millennia, Lake Ohrid maintains aquatic fauna that is unable to survive in less stable freshwater environments, a function it has performed through successive periods of glaciation. Thus, several of its endemic species are also relicts, and the lake is thought to have never experienced a major extinction event (Jovanovska et al, 2015).

Due to the lake's moderating influence on temperature and dryness extremes, this refugium capability extends to the terrestrial habitats surrounding the lake, including Studenchishte Marsh, whose species are in-part conserved by the comparative stability of the regional climate (Spirovska et al, 2012; Sadori et al, 2016). By tempering heat and dryness, the same function can be expected to continue in the Lake Ohrid region during the current climate change period. Also, throughout the National Red List Assessment of amphibians and reptiles, Studenchishte Marsh is representing vital reproductive center for amphibians and therefore it is recognized as a HOT-SPOTS of amphibian diversity (Sterijovski & Arsovski 2019).

Separated from Lake Ohrid by the Mount Galichica massif, Lake Prespa, an existing Ramsar Site, has similar functions. However, since it is relatively shallow and differs hydrologically, chemically and ecologically, the species and ecosystems it supports diverge significantly. Taken together, the two lakes' pastiche of aquatic habitats combined with coastal wetlands at Ezerani, Nakolec, Stenje and Studenchishte offer numerous niches to harbour a diverse range of plants and animals during periods of adversity.

[✓] **Criterion 5 : >20,000 waterbirds**

To justify this Criterion, please give details below on:- the total number of waterbirds and the period of data collection - relevant waterbird species, and if possible their population size, in the section Criteria & justification> Animal species (3.3)

Overall waterbird numbers * (This field is mandatory)

Start year * (This field is mandatory)

2010

End year * (This field is mandatory)

2019

Source of data:

International Waterbird Census, Lake Ohrid Macedonia, performed by Macedonian Ecological Society

Optional text box to provide further information (This field is limited to 3000 characters)

The division of Lake Ohrid between Republic of North Macedonia and Albania causes waterbird counts to be split. Hence, the importance of the site may be underestimated both for overall waterbird numbers and for supporting a significant fraction of waterbird populations for specific species, i.e. Criterion 6.

☒ **Criterion 6 : >1% waterbird population**

To justify this Criterion, please give details on relevant waterbird species and their population size in the section Criteria & justification> Animal species (3.3)

Optional text box to provide further information (This field is limited to 3000 characters)

International Waterbird Census figures from 2010-2016 indicate that average *Netta rufina* (3.3%), *Microcarbo pygmaeus* (1.03%) and *Mergus merganser* (45%) populations at Lake Ohrid cross the 1% threshold for the Black Sea and East Mediterranean biogeographic region in the former two cases and the Balkans biogeographic region for the latter (Wetlands International, 2018). Data from this period has been chosen based on the availability of species breakdowns from the overall International Waterbird Census figures.

☒ **Criterion 7 : Significant and representative fish**

To justify this Criterion, please give information in the box below and details of relevant fish species in the section Criteria & justification> Animal species (3.3)

Justification (This field is limited to 3000 characters)

According to Talevski et al (2009), the rate of endemism among the Lake Ohrid ichthyofauna is 33.3%, calculated on the basis of 21 native fish taxa, 7 of which are endemic to Lake Ohrid: *Salmo ohridanus* Steindachner 1892, *Salmo aphelios*, Kottelat, 1997, *Salmo balcanicus* Karaman, 1928, *Salmo letnica* Karaman, 1924, *Salmo lumi* Poljakov, Filip & Basho 1958, *Barbatula sturanyi* (Steindachner, 1892), and *Gobio ohridanus*, Karaman, 1924. However, since then a genotypic and phenotypic evaluation has indicated *Rutilus ohridanus* as endemic to the lake (Milosevic et al, 2011) as well, which raises the overall number of world unique species to 8 and the endemism rate to 38%.

Lake Ohrid's salmonid fish demonstrate high genetic diversity. The lake has been identified as the probable epicentre for brown trout (*Salmo trutta*) diversity (Duguid, R.A., 2002).

☒ **Criterion 8 : Fish spawning grounds, etc.**

To justify this Criterion, please give information in the box below. Completion of details on relevant fish species in the section Criteria & justification> Animal species (3.3) is optional.

Justification (This field is limited to 3000 characters)

Lake Ohrid contains the only spawning grounds for its 8 endemic fish taxa: *Salmo ohridanus* Steindachner 1892, *Salmo aphelios*, Kottelat, 1997, *Salmo balcanicus* Karaman, 1928, *Salmo letnica* Karaman, 1924, *Salmo lumi* Poljakov, Filip & Basho 1958, *Barbatula sturanyi* (Steindachner, 1892), *Rutilus ohridanus* and *Gobio ohridanus*, Karaman, 1924. Studenchishte Marsh is also a spawning area (Society of Wetland Scientists, 2018).

Spawning sites for Lake Ohrid's endemic salmonids vary by species, but are generally located in rocky, sandy or gravel-based habitats in the littoral and sublittoral zones (Spirkovski, 2004), with the exception of *Salmo lumi*, which prefers sheltered tributaries (Crivelli, 2006), and *Salmo*

ohridana, which will also spawn in Lake Ohrid's shell zone. High-water quality is an important precondition for spawning success. The endemic cyprinid fish *Gobio ohridanus* prefers fine sand between reed belts and the shore (Talevska and Talevski, 2015).

Almost all of the littoral zone holds importance to spawning fish.

[✓] **Criterion 9: >1% non-avian animal population**

To justify this Criterion, please give details on relevant non-avian species and their population size in the section Criteria & justification> Animal species (3.3)

[Optional text box to provide further information](#) *(This field is limited to 3000 characters)*

Lake Ohrid and its springs support the entire populations of over 182 endemic freshwater animal species (Albrecht and Wilke, 2008) across all stages of their lifecycles.

3.2 Plant species whose presence relates to the international importance of the site

Scientific name*	Common name	Criterion 2	Criterion 3	Criterion 4	IUCN Red List ²	CITES Appendix I	Other status	Justification
<i>Carex elata</i>	Tufted sedge			✓				Close to extinction in the Republic of North Macedonia, <i>Carex elata</i> is a protected species at national level, whose importance is heightened by its context in the relict plant community <i>Caricetum elatae</i> (Spirovska et al, 2012), present in Macedonia only at Studenchishte Marsh. The population still holds genetic potential for preservation of the species (Ministry of Environment and Physical Planning, 2014).

<i>Chara kokeilli</i>		✓					CR (Balkans)	Assessed as CR on a global scale by <i>Red Data List of Charophytes in the Balkans</i> (2006).
<i>Chara ohridana</i>		✓	✓				CR (Balkans)	<i>Chara ohridana</i> is known only for Lake Ohrid and a couple

Lake Ohrid – Republic of North Macedonia

								of other locations such as Lake Dojran and Lake Skadar. It is thus a Balkan endemic with limited & fragmented range. Assessed CR (global) by <i>Red Data List of Charophytes in the Balkans</i> (2006).
<i>Chara tomentosa</i>		✓					VU (Balkans)	Assessed as VU by <i>Red Data List of Charophytes in the Balkans</i> (2006).
<i>Nitellopsis obtuse</i>		✓					VU (Balkans)	Assessed as VU by <i>Red Data List of Charophytes in the Balkans</i> (2006).
<i>Nymphaea alba</i>	European White Water Lily	✓			LC			Present at Studenchishte Marsh and identified

								as a strongly threatened species in the Republic of North Macedonia, according to the National Strategy for Biological Diversity (2018-2023). Protected species at national level.
<i>Nuphar lutea</i>		✓			LC			Identified as a strongly threatened species in the Republic of North Macedonia, according to the

								National Strategy for Biological Diversity (2018-2023)
<i>Nymphoides peltata</i>		✓						Identified as a seriously threatened species in the Republic of North Macedonia, according to the National Strategy for Biological Diversity (2018-2023)

Optional text box to provide further information on plant species of international importance:

(This field is limited to 3000 characters)

Although some of the plant species listed in the table above are widespread on a global and/or European level, they are rare within the Republic of North Macedonia due to post-glacial climate change and the widespread loss of wetland habitat over the past century, or have heightened importance due to

the unusual associations they form. This is particularly true for the species listed at Studenchishte Marsh, whose presence may provide a blueprint for wetland rehabilitation at other locations in the country (Apostolova et al, 2016).

According to scientific evaluation of conservation status of selected plant species for future National Red List of RSM, four plant species are evaluated from Ohrud and Struga localities, near Lake Ohrid (Matevski, V, and all., 2019).

- *Angelica palustris* (CR), near spring Sv. Naum, Lake Ohrid; -; - *Trapa natans* (EN), *Salvinia Natans* (VU)

3.3 Animal species whose presence relates to the international importance of the site

Lake Ohrid – Republic of North Macedonia

Optional text box to provide further information on animal species of international importance:

(This field is limited to 3000 characters)

Bird data is often given for both Lakes Ohrid and Prespa combined. Hence, it is presented this way in the species table.

3.4 Ecological communities whose presence relates to the international importance of the site

Name of ecological community	Community qualifies under Criterion 2?	Description	Justification
<p><i>Caricetum</i></p> <p><i>Elatae</i></p>	<p>[✓]</p>		<p>Once a widespread association in the valleys of Macedonia, <i>Caricetum elatae</i> became restricted to the Ohrid region in the post-glacial era due to the relatively more humid climate and wetter conditions there. It is therefore an important and rare relict community.</p> <p>Once inhabiting wetlands at Struga and Studenchishte Marsh, the latter is now the only remaining location in Macedonia due to habitat loss.</p> <p>Studenchishte Marsh offers an important source of <i>Carex elata</i> for potential wetland rehabilitation in other locations.</p>
<p>Charophyte-gastropod communities</p>	<p>✓</p>		<p>Charophyte meadows display rich diversity and host a high density of gastropods, whose explosive endemism is characteristic of</p>

			Lake Ohrid as a Wetland of International Importance. The meadows are also thought to promote speciation processes by acting as a natural barrier (Albrecht and Wilke, 2008).
<i>Cyperetum longi</i>			Rare in the Republic of North Macedonia. Present at Studenchishte Marsh.
<i>Oenantheto-Roripetum Lohm</i>			Rare in the Republic of North Macedonia. Present at Studenchishte Marsh.
<i>Scirpeto-Phragmitetum</i>			Although relatively more common in the Republic of North Macedonia than other wetland plant associations, large areas have nonetheless been drained over the past

Lake Ohrid – Republic of North Macedonia

			century. Present at Studenchishte Marsh.
<i>Sparganio-Glycerietum fluitantis</i>			Although relatively more common in the Republic of North Macedonia than other wetland plant associations, large areas have nonetheless been drained over the past century. Present at Studenchishte Marsh.
<i>Trifolietum nigrescentis-subterranei</i>			This association builds lowland meadows in Macedonia. These habitats are under strong pressure due to abandonment (they are not mowed anymore) and conversion (into different land use types).

[Optional text box to provide further information](#) (This field is limited to 3000 characters)

Myriophylletum-Nypharetum community (W. Koch 1926).

This community completely cover the surface, with large production, and with a thick layer of water meal. Characteristic species are Myriophyllum verticillatum, Nymphaea alba and Nuphar luteum.

Potameto-Najadetum community (H-ci et Micevski, 1960).

This community grows in the shallower zones of the Ohrid shore, in place with calm, warm water.

The depth of the water in the places where this community can be found is 20-60 cm. The surface of places is also covered with a thick layer of water mil.

Hydrocharideto-Nymhoidetum community.

This community is located in marshy areas , near lake, with shallow (40-60 cm), and warm water. In the summer period the water level decreases and the soil becomes exposed. Characteristic plants are Hydrocharis morsus ranae and Utricularia neglecta.

What is the Site like?

4.1 Ecological character

Please summarize the ecological components, processes and services which are critical to determining the ecological character of the site. Please also summarize any natural variability in the ecological character of the site, and any known past or current change

(This field is limited to 4000 characters)

Lake Ohrid is an oligotrophic freshwater with a continuous existence of approximately 1,300,000 to 1,900,000 years (Wagner, 2017). A combination of comparative isolation; stable conditions; and habitat assortment across vertical and horizontal axes has led to the development of unique ecosystems containing over 1,200 species, including at least 200 endemics, many of which have evolved in-lake (Albrecht and Wilke, 2008). These 1,200 species have adapted to Lake Ohrid's clear, low-nutrient, high-oxygen aquatic environment. Some can only survive in waters of this kind.

Such conditions are maintained by karst underground channels that provide 50% of the lake's inflow while partially removing phosphorous en-route; the buffering function of Studenchishte Marsh, a shoreline wetland with additional nutrient-filtering capacity; and macrophyte meadows, all three of which both directly constitute habitat for various, specific species and indirectly facilitate habitat at other lacustrine locations by limiting eutrophication processes and providing the high-quality water-conditions required by taxa that are key to ecosystem functioning such as salmonid fish, the in-lake apex predators.

The karst underground channels supply water both from Lake Prespa and atmospheric precipitation to surface and sub-lacustrine springs. Due to chemical processes that occur along the way and the array of karst pathways, the water that arrives at the springs is nutrient-limited; differs from that of the lake proper; and varies chemically from source to source, producing a subtle diversity of aquatic habitats (Matzinger et al, 2006; Matter et al, 2010; Jordanoska et al, 2010). As a result, invertebrate fauna diverges both from one spring complex to another and with the lake proper. Each contains endemic taxa.

Moving to the main water body, Lake Ohrid's transparency penetrates endemic phytoplankton species to greater depths where more nutrients are available. The phytoplankton in turn furnish zooplankton communities and the fish that predate upon them. High rates of dissolved oxygen open habitats for benthic fauna up to 150m from the lake surface (Matzinger et al, 2006a). The result is endemism at every trophic layer.

After the profundal zone, the sublittoral and littoral are subdivided into belts known as the sand/silt (35-50m depth), shell (20-35m), *Chara* (3-20m) and rock/sand (0-3m), varied habitats that support different species compositions. Species distribution (and evolution) is further influenced by heterogeneous sedimentation patterns and horizontal differences in hydrology, ecology and geology, all of which define the ecological arena through niche habitats.

The *Chara* Belt refers to the several *Chara* species growing in an almost continuous line around the lake, some of which are Balkan endemics. Aside from providing habitat, these may drive speciation processes by acting as barriers between invertebrate populations (Albrecht & Wilke, 2008). Macrophyte flora is also represented by *Potamogeton*, *Phragmites* and *Cladophora* belts, which provision food, shelter and spawning locations for 8 of 12 cyprinid fish taxa, including 2 endemics (Talevska and Talevski, 2005). This is in contrast to the rocky and sandy locations where salmonid fish spawn.

In transition between aquatic and terrestrial habitats, Studenchishte Marsh is one of Lake Ohrid's most important ecotones. Containing alkaline marshes and fens, Studenchishte has been in constant

communication with the lake proper for many thousands of years. Although water channels have been interrupted in recent times, connection still occurs by underground water passages. The final remains of onetime extensive shoreline wetlands, Studenchishte has a

historical function as a nesting, spawning and wintering ground for birds and fish. Diminished by land-use changes and habitat degradation, it is yet home to relict plants, nationally rare insects, endemic invertebrates, and protected herpetofauna (Spirovska et al, 2012; Apostolova et al, 2016).

The past century has seen large anthropogenic impact at Lake Ohrid: loss of coastal wetlands, overfishing, evident eutrophication et cetera (Kostoski et al, 2010).

4.2 What wetland type(s) are in the site?

Please list all wetland types which occur on the site, and for each of them: - rank the four most abundant types by area from 1 (greatest extent) to 4 (least extent) in the third column, - if the information exists, provide the area (in ha) in the fourth column - if this wetland type is used for justifying the application of Criterion 1, indicate if it is representative, rare or unique in the last column - you can give the local name of the wetland type if different from the Ramsar classification system in the second column

Marine or coastal wetlands

Wetland types (code and name) ⁵	Local name	Ranking of extent (1: greatest - 4: least)	Area (ha) of wetland type	Justification of Criterion 1 ⁶
---	------------	--	------------------------------	--

⁹ No impacts | Potentially | Actually (minor impacts) | Actually (major impacts)

Lake Ohrid – Republic of North Macedonia

Insecta	<i>convexiuscula</i>					Studenchishte Marsh for Republic of North Macedonia.
Arthropoda/ Insecta	<i>Stenolophus skrimshiranus</i>					Species only recorded at Studenchishte Marsh for Republic of North Macedonia.
Arthropoda/ Insecta	<i>Brachinus elegans</i>					Species only recorded at Studenchishte Marsh for Republic of North Macedonia.
Arthropoda/ Insecta	<i>Stenolophus proximus</i>					Species only recorded at Studenchishte Marsh for Republic of North Macedonia.
Arthropoda/ Insecta	<i>Pterostichus elongates</i>					Species only recorded at Studenchishte Marsh for Republic of North Macedonia.
Arthropoda/ Insecta	<i>Oodes helopioides</i>					Species only recorded at Studenchishte Marsh for Republic of North Macedonia.
Arthropoda/ Insecta	<i>Oodes gracilis</i>					Species only recorded at Studenchishte Marsh for Republic of North Macedonia.
Chordata/ Amphibia	<i>Bombina variegata</i>	Yellow-bellied Toad				Protected species (Republic of North Macedonia).

						Present in Studenchishte Marsh.
Chordata/ Amphibia	<i>Hyla arborea</i>	European Tree Frog				Protected species (Republic of North Macedonia). Present in Studenchishte Marsh.
Chordata/ Amphibia	<i>Rana dalmatina</i>	Agile Frog				Protected species (Republic of North Macedonia). Present in Studenchishte Marsh.
Chordata/ Amphibia	<i>Triturus</i> (<i>carniflex</i>) <i>macedonicus</i>	Macedonian Crested Newt				Protected species (Republic of North Macedonia). Population in decline due to loss of wetland habitats. Present at Studenchishte Marsh.
Chordata/Aves	<i>Acrocephalus</i> <i>palustris</i>	Marsh Warbler				Passage/Dispersion common for Lakes Ohrid and Prespa.

Lake Ohrid – Republic of North Macedonia

Chordata/ Aves	<i>Anas acuta</i>	Northern Pintail				Protected species (Republic of North Macedonia). Recorded for Studenchishte Marsh.
Chordata/ Aves	<i>Ardea purpurea</i>	Purple Heron				Strictly protected species (Republic of North Macedonia). CMS Appendix II. Recorded for Studenchishte Marsh.
Chordata/ Aves	<i>Ardeola ralloides</i>	Squacco Heron				Strictly protected species (Republic of North Macedonia). Recorded for Studenchishte Marsh.
Chordata/ Aves	<i>Botaurus stellaris</i>	Eurasian Bittern				Strictly protected species (Republic of North Macedonia). CMS Appendix II. Recorded for Studenchishte Marsh. Migratory/dispersion recorded for Lake Ohrid.
Chordata/Aves	<i>Calidris minuta</i>	Little Stint				Passage/ Dispersion 0-100.
Chordata/Aves	<i>Cettia cetti</i>	Cetti's Warbler				Passage/ Dispersion: Common for Lakes Ohrid and Prespa.

Chordata/ Aves	<i>Charadrius dubius</i>	Little Ringed Plover				Passage/ Dispersion 10-100 individuals.
Chordata/ Aves	<i>Ciconia ciconia</i>	White Stork				Strictly protected species (Republic of North Macedonia). CMS Appendix II. Recorded for Studenchishte Marsh.
Chordata/ Aves	<i>Circus aeruginosus</i>	Western Marsh Harrier				Strictly protected species (Republic of North Macedonia). Recorded for Studenchishte Marsh.
Chordata/ Aves	<i>Egretta garzetta</i>	Little Egret				Strictly protected species (Republic of North Macedonia). Recorded for Studenchishte Marsh.
Chordata/ Aves	<i>Hydrocoloeus minutus</i>	Little Gull				Accidental passage/ dispersion 0-30 individuals.
Chordata/ Aves	<i>Motacilla alba</i>	White Wagtail				Passage/ Dispersion common for Lakes Ohrid & Prespa.

Lake Ohrid – Republic of North Macedonia

Chordata/ Aves	<i>Motacilla cinerea</i>	Grey Wagtail				Passage/ Dispersion common for Lakes Ohrid & Prespa.
Chordata/ Aves	<i>Motacilla flava</i>	Western Yellow Wagtail				Passage/ Dispersion common for Lakes Ohrid & Prespa.
Chordata/ Aves	<i>Nycticorax nycticorax</i>	Black- crowned Night Heron				Strictly protected species (Republic of North Macedonia). Recorded for Studenchishte Marsh.
Chordata/ Aves	<i>Panurus biarmicus</i>	Bearded Parrotbill				Passage/dispersion: Common
Chordata/ Aves	<i>Plegadis falcinellus</i>	Glossy Ibis				Strictly protected species (Republic of North Macedonia). CMS Appendix II. Recorded for Studenchishte Marsh.
Chordata/ Aves	<i>Podiceps grisegena</i>	Red-necked Grebe				CMS Appendix II; Accidental passage/ dispersion recorded.
Chordata/ Aves	<i>Remiz pendulinus</i>	Eurasian Penduline Tit				Passage/dispersion: Common
Chordata/ Reptilia	<i>Emys orbicularis</i>	European Pond Turtle				Protected species (Republic of North Macedonia). Population in decline due to loss of wetland habitats. Present at Studenchishte Marsh.

Chordata/ Reptilia	<i>Natrix tessellata</i>	Tessellated Water Snake				Protected species (Republic of North Macedonia). Population in decline due to loss of wetland habitats. Present at Studenchishte Marsh.

4.4 Physical components

4.4.1 Climate

Please indicate the prevailing climate type(s) by selecting below the climatic region(s) and subregion(s), using the Köppen-Gieger Climate Classification System.

Climatic region ¹⁰	Subregion ¹¹
C	Sa

If changing climatic conditions are affecting the site, please indicate the nature of these changes:

(This field is limited to 1000 characters)

Ecological changes such as in the zooplankton community (including recent invasions by *Diaphanosoma brachiurum* and *Leptodora kintii*) may be linked to warming lake waters (Kostoski et al, 2010). Eutrophication has been predicted to accelerate with climate change (Matzinger et al, 2007) and decreased vertical mixing/complete deep convections in the recent past is also possibly climate-related.

4.4.2 Geomorphic setting

a) Minimum elevation above sea level (in metres) (The online RIS only accepts numeric values)

693m

a) Maximum elevation above sea level (in metres) (The online RIS only accepts numeric values)

696m

b) Position in landscape/river basin:

- ☐ Entire river basin
- ☒ Upper part of river basin
- ☐ Middle part of river basin
- ☐ Lower part of river basin
- ☐ More than one river basin
- ☐ Not in river basin
- ☐ Coastal

Please name the river basin or basins. If the site lies in a sub-basin, please also name the larger river basin. For a coastal/marine site, please name the sea or ocean. (This field is limited to 1000 characters)

Drim Basin

4.4.3 Soil

- ☐ Mineral
- ☒ Organic
- ☐ No available information

Are soil types subject to change as a result of changing hydrological conditions (e.g., increased salinity or acidification)?

10 A. Tropical humid climate | B. Dry climate | C. Moist Mid-Latitude climate with mild winters | D. Moist Mid-Latitude climate with cold winters | E. Polar climate with extremely cold winters and summers | H. Highland

11 Af: Tropical wet (No dry season) | Am: Tropical monsoonal (Short dry season; heavy monsoonal rains in other months) | Aw: Tropical savanna (Winter dry season) | BWh: Subtropical desert (Low-latitude desert) | BSh: Subtropical steppe (Low-latitude dry) | BWk: Mid-latitude desert (Mid-latitude desert) | BSk: Mid-latitude steppe (Mid-latitude dry) | Csa:

Mediterranean (Mild with dry, hot summer) | Csb: Mediterranean (Mild with dry, warm summer) | Cfa: Humid subtropical

(Mild with no dry season, hot summer) | Cwa: Humid subtropical (Mild with dry winter, hot summer) | Cfb: Marine west

coast (Mild with no dry season, warm summer) | Cfc: Marine west coast (Mild with no dry season, cool summer) | Dfa:

4.4.4 Water regime

Water permanence

Presence?¹²

Permanent

Source of water that maintains character of the site

Presence? ¹³	Predominant water source
Water inputs from groundwater	<input checked="" type="checkbox"/>

Water inputs from surface water	
Water inputs from rainfall	

Water destination

Presence? ¹⁴
To downstream catchment

Stability of water regime

Presence? ¹⁵
Stable (Lake Ohrid); Fluctuating

(Studenchishte Marsh)

Please add any comments on the water regime and its determinants (if relevant). Use this box to explain sites with complex hydrology: (This field is limited to 2000 characters)

With a comparatively small catchment of 2,600 km², Lake Ohrid receives approximately 54% of its water from subterranean karst channels, 23% from direct precipitation, and the remaining 23% from overland inflows (Albrecht & Wilke, 2008), including most majorly the River Sateska, which was artificially diverted into the lake in 1961/62, River Koselska, River Cerava, River Pogradec,

and River Verdova. Several other smaller streams cease to flow in dry conditions.

The aforementioned karst channels run through Mount Galichica on the lake's eastern shore and emerge as surface (51% by water volume) and sublacustrine springs (49%). They are predominantly fed by waters from Lake Prespa on the other side of the mountain, although a significant contribution originates from precipitation that has been absorbed into the highly porous mountain as well (Albrecht and Wilke, 2008).

A single outflow, the River Black Drim, accounts for 60% of Lake Ohrid's exiting water (Matzinger et al, 2006a). The remaining 40% is lost to evaporation. Due to artificial regulation for hydroelectric dams, the Lake Ohrid water level is (generally) held between 693.10m and 693.75m. This is legally mandated although fluctuations beyond these parameters have been known to occur.

Studenchishte Marsh's groundwaters flow northeast to southwest and derive from precipitation that has been filtered through Mount Galichica. An important source of both its water and that of the lake proper is Biljanini Springs. During high-water extremes, Lake Ohrid and Studenchishte Marsh fully merge. To date, the movement of groundwater between Studenchishte and Lake Ohrid has not been sufficiently researched (Spirovska et al, 2012).

Connectivity of surface waters and of groundwater (ECD)

Stratification and mixing regime (ECD)

At depths above 150m, Lake Ohrid's water is layered by temperature from March to November. Below 150m, it is stratified by salinity. Complete mixing takes place roughly once per decade during exceptionally cold winters. The water residence time is 70 years (Albrecht and Wilke, 2008).

¹² Usually permanent water present | Usually seasonal, ephemeral or intermittent water present | Unknown

¹³ Water inputs from rainfall | Water inputs from surface water | Water inputs from groundwater | Marine water | Unknown

¹⁴ Feeds groundwater | To downstream catchment | Marine | Unknown

¹⁵ Water levels largely stable | Water levels fluctuating (including tidal) | Unknown

4.4.5 Sediment regime

☒ Significant erosion of sediments occurs on the site

☒ Significant accretion or deposition of sediments occurs on the site

☒ Significant transportation of sediments occurs on or through the site

☐ Sediment regime is highly variable, either seasonally or inter-annually

☐ Sediment regime unknown

Please provide further information on sediment (optional): *(This field is limited to 1000 characters)*

Sediment accretion is the basis for some of the most important ecosystem services of Lake Ohrid: biodiversity and paleoenvironmental archives. Diverse habitats created by the non-uniform distribution/structure of sediments are thought to contribute to speciation processes.

Surface sedimentation displays significant heterogeneity due to the varied geological catchment, anthropogenic land use and anticlockwise water currents. Coarser grain sizes are proximate to river outlets, while finer sand and clay materials become more prevalent at greater depths. Wind-driven surface currents are the main transport mechanism, while tectonically induced turbidity currents account for irregular movements of larger material to deeper zones (Vogel, 2010).

Increased sediment loads from human influences such as redirection of the River Sateska, deforestation, and intensive agriculture are causing sediment homogenization and elevated nutrient inputs with associated changes to species compositions.

Water turbidity and colour (ECD)

Light - reaching wetland (ECD)

Water temperature (ECD)

4.4.6 Water pH

☐ Acid (pH<5.5)

☐ Circumneutral (pH: 5.5-7.4)

☒ Alkaline (pH>7.4)

☐ Unknown

Please provide further information on pH (optional): *(This field is limited to 1000 characters)*

4.4.7 Water salinity

☒ Fresh (<0.5 g/l)

☐ Mixohaline (brackish)/Mixosaline (0.5-30 g/l)

☐ Euhaline/Eusaline (30-40 g/l)

☐ Hyperhaline/Hypersaline (>40 g/l)

☐ Unknown

Please provide further information on salinity (optional): *(This field is limited to 1000 characters)*

Dissolved gases in water (ECD)

4.4.8 Dissolved or suspended nutrients in water

☐ Eutrophic

☐ Mesotrophic

☒ Oligotrophic

☐ Dystrophic

☐ Unknown

Please provide further information on dissolved or suspended nutrients (optional): *(This field is limited to 1000 characters)*

Although Lake Ohrid remains oligotrophic, anthropogenic eutrophication is evident, particularly in the littoral zone.

Dissolved organic carbon (ECD)

Redox potential of water and sediments (ECD)

Water conductivity (ECD)

4.4.9 Features of the surrounding area which may affect the Site

Please describe whether, and if so how, the landscape and ecological characteristics in the area surrounding the Ramsar Site differ from the site itself:

☐

☐ i) broadly similar / ☒ ii) significantly different

If the surrounding area differs from the Ramsar Site, please indicate how: (Please tick all categories that apply)

☒ Surrounding area has greater urbanisation or development
☐ Surrounding area has higher human population density ☒
Surrounding area has more intensive agricultural use

☐ Surrounding area has significantly different land cover or habitat types

Please describe other ways in which the surrounding area is different: *(This field is limited to 2000 characters)*

It is not a lake.

4.5 Ecosystem services

4.5.1 Ecosystem services/benefits

Please select below all relevant ecosystem services/benefits currently provided by the site and indicate their relative importance in the right-hand column.

Provisioning Services

Ecosystem service ¹⁶	Examples ¹⁷	Importance/Extent/Significance ¹⁸
Fresh water	Drinking water for humans	High
Fresh water	Water for irrigated agriculture	Medium
Fresh water	Water for energy production	Medium
Food for humans	Fish	Medium
Wetland non-food product	Other	Low

Regulating Services

Ecosystem service ¹⁹	Examples ²⁰	Importance/Extent/Significance ¹⁸
Pollution control and detoxification	Soil, sediment and nutrient retention	High
Maintenance of hydrological regimes	Groundwater recharge and discharge	High

Climate regulation	Local climate regulation/buffering of change	High
Climate regulation	Regulation of greenhouse gases, temperature and precipitation other	Low

¹⁶ Food for humans | Fresh water | Wetland non-food products | Biochemical products | Genetic materials

¹⁷ Sustenance for humans (e.g., fish, molluscs, grains) | Drinking water for humans and/or livestock | Water for irrigated

agriculture | Water for industry | Water for energy production (hydro-electricity) | Timber | Fuel wood/fibre | Peat | Livestock fodder | Reeds and fibre | Other | Extraction of material from biota | Medicinal products | Genes for tolerance to certain conditions (e.g., salinity) | Genes for resistance to plant pathogens | Ornamental species (live and dead)

¹⁸ not relevant for site | Low | Medium | High

¹⁹ Maintenance of hydrological regimes | Erosion protection | Pollution control and detoxification | Climate regulation | Biological control of pests and disease | Hazard reduction

²⁰ Groundwater recharge and discharge | Storage and delivery of water as part of water supply systems for agriculture and industry | Soil, sediment and nutrient retention | Water purification/waste treatment or dilution | Local climate regulation/buffering of change | Regulation of greenhouse gases, temperature, precipitation and other climactic processes | Support of predators of agricultural pests (e.g., birds feeding on locusts) | Flood control, flood storage | Coastal shoreline and river bank stabilization and storm protection

	climatic processes	
Maintenance of hydrological regimes	Flood control, flood storage	Low

Cultural Services

Ecosystem service²¹	Examples²²	Importance/Extent/Significance¹⁸
Recreation and tourism	Picnics, outings, touring	High
Recreation and tourism	Water sports and activities	High

²² Recreational hunting and fishing | Water sports and activities | Picnics, outings, touring | Nature observation and nature-based tourism | Inspiration | Cultural heritage (historical and archaeological) | Contemporary cultural significance, including for arts and creative inspiration, and including existence values | Spiritual and religious values | Aesthetic and sense of place values | Educational activities and opportunities | Important knowledge systems, importance for research (scientific reference area or site) | Long-term monitoring site | Major scientific study site | Type location for a taxon

Spiritual and inspirational	Contemporary cultural significance, including for arts and creative inspiration, and including existence values	High
Recreation and tourism	Recreational hunting and fishing	Medium
Recreation and tourism	Nature observation and nature-based tourism	Low

Supporting Services

Ecosystem service ²³	Examples ²⁴	Importance/Extent/Significance ¹⁸
Biodiversity	Supports a variety of all life forms including plants, animals and microorganisms, the genes they contain, and the ecosystems of which they form a part	High

Nutrient cycling	Storage, recycling, processing and acquisition of nutrients	High
Soil formation	Carbon sequestration	Low

Other ecosystem service(s) not included above: *(This field is limited to 2000 characters)*

Studenchishte Marsh's groundwaters flow northeast to southwest and derive from precipitation that has been filtered through Mount Galichica. An important source of both its water and that of the lake proper is Biljanini Springs. During high-water extremes, Lake Ohrid and Studenchishte Marsh fully merge. To date, the movement of groundwater between Studenchishte and Lake Ohrid has not been sufficiently researched.

Sublittoral and littoral are subdivided into belts known as the sand/silt with varied habitats have support existing of different habitats types and species diversity. Distribution of species is further influenced by heterogeneous sedimentation patterns and horizontal differences in hydrology, ecology and geology, all of which define the ecological arena through niche habitats.

Lake Ohrid and Studenchishte Marsh are key components of the World Natural and Cultural Heritage of the Ohrid Region, globally recognized for their Outstanding Universal Value to humankind and one of only 38 sites to receive UNESCO status for both natural and cultural importance.

²³ Biodiversity | Soil formation | Nutrient cycling | Pollination

²⁴ Supports a variety of all life forms including plants, animals and microorganisms, the genes they contain, and the ecosystems of which they form a part | Sediment retention | Accumulation of organic matter | Storage, recycling, processing and acquisition of nutrients | Carbon storage/sequestration | Support for pollinators

Present-day biodiversity, particularly invertebrate species which can be fossilized in statistically significant numbers, facilitates paleoecological, paleoenvironmental and paleoclimatic reconstructions over hundreds of thousands of years (Lorenschat et al, 2013; Wagner et al, 2017).

Continuous human settlements over eight millennia combined with archaeological and sediment core analyses permit investigations of human history across several distinct societal, cultural and religious frameworks including neolithic communities, and ancient Greek, ancient Roman, Byzantine, and Ottoman empires. Lake Ohrid and Studenchishte Marsh therefore offer a relatively unique opportunity to study the interplay between humans and wetlands in pluralized contexts. Current research based on underwater archaeology and paleoecological techniques is focused on the development of European agriculture and its adjustment to climate change over thousands of years (Universitat Bern, 2018).

Ohrid pearls, derived from the scales of the plasica fish (*Alburnus scoranza*), are crafted according to a specific and secretive local technique. The resulting jewellery is represented in the collections of European royal families.

Evidence of the spiritual connection between humans and wetlands abounds in the Ohrid region too: Archaeological remains of the Studenchishte Basilica, located immediately above Studenchishte Marsh, are an example of early Christian sacral architecture dating back to the fifth or sixth century. The basilica was erected at the site of an earlier, pre-Christian religious site undoubtedly linked to the worship of water.

The springs of Sveti Naum are associated with the Monastery of Sveti Naum, which is a site of enormous significance to Slavic and Orthodox Christian culture as the former residence of Saint Naum, a religious figure renowned for his learning, whose legacy extends to the development of Slavic literacy. Numerous other sites of religious significance surround the Lake Ohrid Ramsar Site, most notably the Church of Sveti Jovan Kaneo, Sveta Sofija Cathedral and the Monastery of Saint Zaum.

Lake Ohrid is a major location for the annual Vodici ritual. Celebrated in January, Vodici sees hundreds of worshippers dive into the lake waters to retrieve a cross.

Please make a rough estimate of the approximate number of people who directly benefit from the ecological services provided by this site (estimate at least in orders of magnitude: 10s, 100s, 1000s, 10 000s etc.):

Within the site:

Outside the site:

500,000 residents and visitors yearly, although this does not include the downstream beneficiaries of fresh water and hydroelectric energy.

Have studies or assessments been made of the economic valuation of ecosystem services provided by this Ramsar Site?

☐ Yes / ☒ No / ☐ Unknown

Where economic studies or assessments of economic valuation have been undertaken at the site, it would be helpful to provide information on where the results of such studies may be located (e.g. website links, citation of published literature): *(This field is limited to 2500 characters)*

4.5.2 Social and cultural values

Is the site considered internationally important for holding, in addition to relevant ecological values, examples of significant cultural values, whether material or non-material, linked to its origin, conservation and/or ecological functioning? If so, please describe this importance under one or more of the four following

categories. You should not list here any values derived from non-sustainable exploitation or which result in detrimental ecological changes.

☐ i) the site provides a model of wetland wise use, demonstrating the application of traditional knowledge and methods of management and use that maintain the ecological character of the wetland

Description if applicable *(This field is limited to 2500 characters)*

☐ ii) the site has exceptional cultural traditions or records of former civilizations that have influenced the ecological character of the wetland

Description if applicable *(This field is limited to 2500 characters)*

☐ iii) the ecological character of the wetland depends on its interaction with local communities or indigenous peoples

Description if applicable *(This field is limited to 2500 characters)*

☐ iv) relevant non-material values such as sacred sites are present and their existence is strongly linked with the maintenance of the ecological character of the wetland

Description if applicable *(This field is limited to 2500 characters)*

4.6 Ecological processes

This section is not intended for completion as part of a standard RIS, but is included for completeness as part of the agreed format of a 'full' Ecological Character Description (ECD) outlined by Resolution X.15

Primary production (ECD)

Studenchishte Marsh's groundwaters flow northeast to southwest and derive from precipitation that has been filtered through Mount Galichica. An important source of both its water and that of the lake proper is Biljanini Springs. During high-water extremes, Lake Ohrid and Studenchishte Marsh fully merge. To date, the movement of groundwater between Studenchishte and Lake Ohrid has not been sufficiently researched.

Sublittoral and littoral are subdivided into belts known as the sand/silt with varied habitats have support existing of different habitats types and species diversity. Distribution of species is further influenced by heterogeneous sedimentation patterns and horizontal differences in hydrology, ecology and geology, all of which define the ecological arena through niche habitats.

Nutrient cycling (ECD)

Carbon cycling (ECD)

Animal reproductive productivity (ECD)

Vegetational productivity, pollination, regeneration processes, succession, role of fire, etc. (ECD)

Notable species interactions, including grazing, predation, competition, diseases and pathogens (ECD)

Notable aspects concerning animal and plant dispersal (ECD)

Notable aspects concerning migration (ECD)

Pressures and trends concerning any of the above, and/or concerning ecosystem integrity (ECD)

Lake Ohrid and Studenchishte Marsh are key components of the World Natural and Cultural Heritage of the Ohrid Region, globally recognized for their Outstanding Universal Value to humankind and one of only 38 sites to receive UNESCO status for both natural and cultural importance.

How is the Site managed?

5.1 Land tenure and responsibilities (Managers)

5.1.1 Land tenure/ownership

Please specify if this category applies to the Ramsar Site, to the surrounding area or to both, by ticking the relevant option(s).

Public ownership

Category ²⁵	Within the Ramsar Site	In the surrounding area
Local authority	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>

Private ownership

Category ²⁶	Within the Ramsar Site	In the surrounding area
Commercial company	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>
Other types of private/individual owner	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>
Religious body	<input checked="" type="checkbox"/>	<input type="checkbox"/>

Other

Provide further information on the land tenure / ownership regime (optional): (This field is limited to 1000 characters)

5.1.2 Management authority

Please list the local office / offices of any agency or organization responsible for managing the site: *(This field is limited to 1000 characters)*

Municipality of Ohrid,

Str. Dimitar Vlahov 57,

6000 Ohrid,

Municipality of Struga

Majka Teresa Square 6.6

Struga

Municipality of Debarca

Belchishta, Debarca, 6344

²⁵ Public land (unspecified) | National/Federal government | Provincial/region/state government | Local authority, municipality, (sub)district, etc. | Other public ownership

²⁶ Cooperative/collective (e.g., farmers cooperative) | Commercial (company) | Foundation/non-governmental organization/trust | Religious body/organization | Other types of private/individual owner(s)

²⁷ Unspecified mixed ownership | No information available | Commoners/customary rights

Provide the name and title of the person or people with responsibility for the wetland:

Mayor of Municipality of Ohrid, Struga and Debarca

Postal address: *(This field is limited to 1000 characters)*

Municipality of Ohrid,

Str. Dimitar Vlahov 57,
6000 Ohrid,

Municipality of Struga

Majka Teresa Square 6.6
Struga

Municipality of Debarca

Belchishta, Debarca, 6344

E-mail address: *(The online RIS only accepts valid e-mail addresses, e.g. example@mail.com)*

Climate change and severe weather

Factors adversely affecting site ⁴⁰	Actual threat ²⁹	Potential threat ²⁹	Within the site	In the surrounding area
Habitat shifting and altering	High	High	✓	✓
Droughts	High	High	✓	✓
Temperature extremes	Medium	High	✓	
Storms and flooding	Low	Medium	✓	✓

Please describe any other threats (optional): (This field is limited to 3000 characters)

The construction of landfills in the watershed is of concern due to the countrywide experience with their substandard quality by European Union standards. Illegal dumps are a related issue.

Legal provisions for wetland conservation are insufficient. Legislation aimed at nature protection is often in conflict with or subordinate to other laws. Even when a robust legal framework is theoretically in place, implementation is inconsistent in part because enforcement responsibilities are poorly defined/understood. Economic, infrastructure and tourism development strategies/policies are weakly aligned with wetland protection aims.

The research potential of Lake Ohrid's ecosystems is high. However, there is no functional system to ensure sustainable use of resources, leaving a high risk of over-exploitation from discoveries.

Strategic Environmental Assessments are under-researched and routinely contain important omissions, particularly of complete plans and full cumulative impacts. The mitigation hierarchy is not meaningfully applied.

5.2.2 Legal conservation status

Please list any other relevant conservation status, at global, regional or national level and specify the boundary relationships with the Ramsar Site:

Global legal designations

Designation	Name of area	Online information url	Overlap with

5.2.5 Management planning

Is there a site-specific management plan for the site?

Yes⁵⁰

Is the management plan/planning implemented?

☐

[] Yes / [x] No

The management plan covers

All of the Ramsar Site⁵¹

Is the management plan currently subject to review and update?

☐☐

[] Yes / [x] No

Has a management effectiveness assessment been undertaken for the site?

☐

[] Yes / [x] No

Please give link to site-specific plan or other relevant management plan if this is available via the Internet or upload it in section 'Additional material': *(This field is limited to 500 characters)*

If the site is a formal transboundary site as indicated in section Data and location > Site location, are there shared management planning processes with another Contracting Party?

☐

[] Yes / [x] No

Please indicate if a Ramsar centre, other educational or visitor facility, or an educational or visitor programme is associated with the site: *(This field is limited to 1000 characters)*

URL of site-related webpage (if relevant):

5.2.6 Planning for restoration

Is there a site-specific restoration plan?

⁵²No; but restoration is needed

⁵⁰No | Yes | In preparation

⁵¹ All of Ramsar Site | Part of Ramsar Site

⁵² Please select a value | No need identified | No; the site has already been restored | No; but restoration is needed | No; but a plan is being prepared | Yes; there is a plan

Has the plan been implemented?

☐

[] Yes / [x] No

The restoration plan covers:

Is the plan currently being reviewed and updated?

☐

[] Yes / [x] No

Where the restoration is being undertaken to mitigate or respond to a threat or threats identified in this RIS, please indicate it / them: *(This field is limited to 1000 characters)*

Further information *(This field is limited to 2500 characters)*

Studenchishte Marsh on the north east coast requires removal of solid waste, reestablishment of certain connections with the lake proper and rewetting of degraded areas in order both to revitalize its own biodiversity and secure the ecosystem services it provides to the wider lacustrine area.

Rogue dumpsites at other locations, particularly surrounding the city of Struga, also require solid waste removal.

The mouths of inflows, particularly the River Sateska, and their vicinities need measures to prevent eutrophication, pollution and stem anthropogenic sedimentation.

The littoral zone, especially near the mouths of inflows, and Studenchishte Canal have been assessed with poor ecological status, based on sampling of macroinvertebrate fauna (Trajanovski et al, 2019). Pressures and disturbances must be reduced to the entire littoral zone both to reverse this decline and secure breeding areas for native fish, especially salmonids.

The springs of Sveti Naum are at risk of degradation from land usurpation, which requires reversal to protect several endemic species.

Maintenance of the water transparency is necessary to conserve endemic phytoplankton and thereby the role they play in the Lake Ohrid food web.

Reed belt loss and deterioration must be addressed and reeds re-established in key areas to arrest declines in the populations of birds and fish and buffer against eutrophication.

To result in stable populations, restocking efforts for *Salmo letnica* and *Anguilla anguilla* require bolstering from other management actions such as reestablishment of habitat quality, connectivity and suitability, pollution controls, and sustainable harvesting.

5.2.7 Monitoring implemented or proposed

Monitoring ⁵³	Status ⁵⁴
Water quality	Implemented
Birds	Implemented

Please indicate other monitoring activities:

(This field is limited to 3000 characters)

⁵³ Water regime monitoring | Water quality | Soil quality | Plant community | Plant species | Animal community | Animal species (please specify) | Birds

⁵⁴ | Implemented | Proposed

Although various monitoring activities have been undertaken, most have either been discontinued or suffer from data gaps. Detailed fish inventories (which were mainly focused on species of commercial interest) have not been undertaken since the nineties, for example.

[] I certify that I am the photographer, the valid holder of rights over the photograph(s), or an authorized representative of the organization which is the valid holder of rights over the photograph(s), and I hereby assign an irrevocable, perpetual and royalty-free right to use, reproduce, edit, display, transmit, prepare derivative works of, modify, publish, affix logos to, and otherwise make use of the submitted photograph(s) in any way, to the Ramsar Convention Secretariat, its affiliates and partners, for non-commercial purposes in conjunction with the mission of the Ramsar Convention. This use includes, but is not limited to, internal and external publication and materials, presentation on the websites of the Ramsar Convention or any affiliated body, and any and all other communication channels with copyright attributed to the holder in all published forms. The full accuracy of all data submitted rests with the submitter, or organization submitting the photograph(s). In submitting, I hereby agree to the aforementioned terms, personally or on behalf of the organization of which I am an authorized official, certifying that the Ramsar Convention Secretariat, its affiliates and partners are explicitly held harmless for any and all costs, expenses, or damages arising from use of the submitted photograph(s) and any additional information provided.
